#### System of Linear Equations, Ax = b1

#### 1.1 p-Norm and Condition Number

$$\underline{\text{Vector } p\text{-Norm}}: \quad \boxed{\|\vec{x}\|_p = \sqrt[p]{\sum_i |x_i|^p}}$$

1-Norm:  $\|\vec{x}\|_1 = \sum_i |x_i|$ 

 $\infty$ -Norm:  $\|\vec{x}\|_{\infty} = \max |x_i|$ 

- $||x||_1 \ge ||x||_2 \ge ||x||_{\infty}$
- $||x||_1 \le \sqrt{n} ||x||_2 \le \sqrt{n} ||x||_{\infty}$

 $\underline{\text{Matrix } p\text{-Norm}}:$ 

$$||A||_p = \max_{x \neq 0} \frac{||Ax||}{||x||}$$

1-Norm:  $||A||_1 = \max_j \sum_i |a_{ij}|$ 

 $\infty$ -Norm :  $||A||_{\infty} = \max_{i} \sum_{i} |a_{ij}|$ 

•  $||AB|| \le ||A|| \cdot ||B||$ •  $||Ax|| \le ||A|| \cdot ||x||$  For p-norms (not necessarily in general)

Function/Vector Condition Number:

$$\operatorname{cond}(f(x)) = \left| \frac{[f(\hat{x}) - f(x)]/f(x)}{[\hat{x} - x]/x} \right|$$
$$= \left| \frac{\Delta y/y}{\Delta x/x} \right| = \left| \frac{y' \cdot \Delta x/y}{\Delta x/x} \right|$$
$$= \left| \frac{xf'(x)}{f(x)} \right|$$

Matrix Condition Number:

$$\frac{\operatorname{cond}_{p}(A) = \|A\|_{p} \cdot \|A^{-1}\|_{p}}{\operatorname{max}_{x \neq 0} \|Ax\|_{p} / \|x\|_{p}} = \operatorname{cond}_{p}(\gamma A) \geq 1$$

- Diagonal,  $D : \operatorname{cond}(D) = \frac{\max |d_i|}{\min |d_i|}$
- $||z|| = ||A^{-1}y|| \le ||A^{-1}|| \cdot ||y||$  $\rightarrow \frac{\|z\|}{\|u\|} \leq \max \frac{\|z\|}{\|u\|} \stackrel{?}{=} \|A^{-1}\| \quad \text{(optimize)}$

# 1.2 Error Bounds and Residuals

$$A\hat{x} = b + \Delta b = Ax + A\Delta x$$

$$\bullet \quad \|b\| \quad \leq \quad \|A\| \cdot \|x\|$$

• 
$$\|\Delta x\| \le \|A^{-1}\| \cdot \|\Delta b\|$$

$$\to \boxed{\frac{\|\Delta x\|}{\|x\|} \le \operatorname{cond}(A) \frac{\|\Delta b\|}{\|b\|}}$$

$$A\hat{x} + r = b$$

• 
$$\|\Delta x\| = \|A^{-1}(A\hat{x} - b)\| = \|-A^{-1}r\|$$
  
 $\leq \|A^{-1}\| \cdot \|r\|$ 

$$\rightarrow \left| \frac{\|\Delta x\|}{\|\hat{x}\|} \le \operatorname{cond}(A) \frac{\|r\|}{\|A\| \cdot \|\hat{x}\|} \right|$$

$$(A + \Delta A)\hat{x} = b$$

• 
$$\|\Delta x\| = \|-A^{-1}(\Delta A)\hat{x}\|$$
  
 $\leq \|A^{-1}\| \cdot \|\Delta A\| \cdot \|\hat{x}\|$ 

$$\to \boxed{\frac{\|\Delta x\|}{\|x\|} \le \operatorname{cond}(A) \frac{\|\Delta A\|}{\|A\|}}$$

$$(A + \Delta A)\hat{x} = b$$

$$\bullet \|r\| = \|b - A\hat{x}\| = \|\Delta A \cdot \hat{x}\|$$

$$\leq \|\Delta A\| \cdot \|\hat{x}\|$$

$$\to \boxed{\frac{\|r\|}{\|A\|\cdot\|\hat{x}\|} \le \frac{\|\Delta A\|}{\|A\|}}, \quad \frac{\|\Delta x\|}{\|x\|} \le \frac{\|A^{-1}\|\cdot\|r\|}{\|\hat{x}\|} \le \operatorname{cond}(A) \quad \frac{\|\Delta A\|}{\|A\|}$$

$$\[A(t)x(t) = b(t)\] = \[(A_0 + \Delta A \cdot t)x(t) = b_0 + \Delta b \cdot t\]$$

• 
$$x'(t) = \frac{b'(t) - A'(t)x(t)}{A(t)} = A^{-1}(t) \left[ \Delta b - \Delta A \cdot x(t) \right]$$

• 
$$x(t) = x_0 + x'(0)t + \mathcal{O}(t^2)$$

$$\rightarrow \boxed{\frac{\|x(t) - x_0\|}{\|x_0\|} \le \operatorname{cond}(A) \left(\frac{\|\Delta b\|}{\|b\|} + \frac{\|\Delta A\|}{\|A\|}\right) |t| + \mathcal{O}(t^2)}$$

#### Gaussian Elimination with LU/PLU/PLDUQ Decomposition 1.3

### Elementary Elimination Matrices, $L_k$

$$\bullet \ \forall i \neq j \ (L_k^{-1})_{ij} = -(L_k)_{i,j}$$

$$\begin{pmatrix} 1 & 0 & \dots \\ -a_1/a_2 & 1 & \dots \\ \vdots & \vdots & \ddots \end{pmatrix} \begin{pmatrix} a_1 \\ a_2 \\ \vdots \end{pmatrix} = \begin{pmatrix} a_1 \\ 0 \\ \vdots \end{pmatrix}$$

## LU/PLU Factorization (w/ partial pivoting)

$$A = LU$$
 (L is gen. triang.)  
(U is upp. triang.)  
 $L = (\dots L_2 P_2 L_1 P_1)^{-1}$ 

$$\{\dots\}b = (\dots L_2 P_2 L_1 P_1) A x$$
$$L^{-1}b = (P_1^T L_1^{-1} P_2^T L_2^{-1} \dots)^{-1} A x$$
$$= L^{-1}(LU)x = y$$

$$b = Ly , \quad y = Ux$$
(forw.-sub.) , (back.-sub.)

- Permutation matrix,  $P_i$ , rowswaps s.t.  $a_k \neq 0$
- $P_i$  rowswaps s.t.  $a_k$  is largest s.t.  $a_{k+i}/a_k \leq 1$ for numerical stability/ minimize errors
- Pivoting isn't needed if A is diag. dom.  $(a_{jj} > \sum_{i,i \neq j} a_{ij})$
- A can be singular

$$A = PLU$$
 ( $P$  is rowswap permu.)  
( $L$  is unit low. triang.)  
( $U$  is upp. triang.)  
 $P = (\dots P_2 P_1)^{-1}$ 

$$\{\dots\}b = (\dots P_2 P_1) A x$$
$$P^T b = (P_1^T P_2^T \dots)^{-1} A x$$
$$= P^T (PLU) x = L y$$

$$P^T b = L y \ , \ \ y = U x$$

$$P^T A = LDU \qquad \text{(D is diag.)}$$

- ullet LDU is unique up to D
- LDU is unique if L/U are unit low./upp. diag., resp.

$$P^TAQ^T = LDU \qquad \begin{tabular}{l} \mbox{(P is permu. for rows)} \\ \mbox{(Q is permu. for cols.)} \end{tabular}$$

- "Complete pivoting" search for largest  $a_k$
- Would be most numerically stable
- Expensive, so not really used

Error Bound: 
$$\frac{\|r\|}{\|A\|\|x\|} \le \frac{\|\Delta A\|}{\|A\|} \le \rho n^2 \epsilon_{\text{mach}} \sim n \epsilon_{\text{mach}}$$
 (Wilkinson) (usually)

(growth factor,  $\rho$ , is the largest entry at any point during factorization - usually at U divided by the largest entry of A)

#### 1.4 Gaussian-Jordan with MD Decomposition

### Elementary Elimination Matrices, $M_k$

$$\begin{pmatrix} 1 & \dots & \frac{-a_1}{a_k} & 0 & \dots & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & 1 & 0 & \dots & 0 \\ 0 & \dots & \frac{-a_{k+1}}{a_k} & 1 & \dots & 0 \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & \frac{-a_n}{a_k} & 0 & \dots & 1 \end{pmatrix} \begin{pmatrix} a_1 \\ \vdots \\ a_{k-1} \\ a_k \\ a_{k+1} \\ \vdots \\ a_n \end{pmatrix} = \begin{pmatrix} 0 \\ \vdots \\ 0 \\ a_k \\ 0 \\ \vdots \\ 0 \end{pmatrix}$$

$$\bullet a_k \text{ is the "pivot"}$$

$$\bullet \forall i \neq j \quad (M_k^{-1})_{ij} = -(M_k)_{ij}$$

## MD Factorization (w/ partial pivoting)

$$A = MD$$
 (M is elem. elim.)  
 $(D \text{ is diag.})$   
 $M = (\dots M_2 P_2 M_1 P_1)^{-1}$ 

$$\{\dots\}b = (\dots M_2 P_2 M_1 P_1) A x$$

$$M^{-1}b = (P_1^T M_1^{-1} P_2^T M_2^{-1} \dots)^{-1} A x$$

$$= M^{-1} (MD) x = y$$

$$M^{-1}b = y , \quad y = Dx$$
 (division)

- Permutation matrix,  $P_i$ , rowswaps s.t.  $a_k \neq 0$
- $P_i$  rowswaps cannot ensure numerical stability ( $\leq 1$ )
- Division is  $\mathcal{O}(n)$ , so may be useful for parallel comps.
- Can also find A<sup>-1</sup>

# Finding $A^{-1}$ $D^{-1}M^{-1}(A|I) = (I|A^{-1})$ $=D^{-1}M^{-1}\begin{bmatrix}a_{11}&\cdots&1&0\\\vdots&a_{nn}&0&1\end{bmatrix}$ $= \begin{bmatrix} 1 & 0 & a'_{11} & \dots \\ 0 & 1 & \vdots & a'_{nn} \end{bmatrix}$

#### Symmetric Matrices 1.5

Positive Definite:  $|x^T Ax| > 0$ 

Cholesky Factorization for Sym., Pos. Def.:  $A = LL^T = LDL^T$ 

$$\begin{pmatrix} a_{11} & a_{21} & a_{31} & \dots \\ a_{21} & a_{22} & a_{32} & \dots \\ a_{31} & a_{32} & a_{33} & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix} = \begin{pmatrix} l_{11} & 0 & 0 & \dots \\ l_{21} & l_{22} & 0 & \dots \\ l_{31} & l_{32} & l_{33} & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix} \begin{pmatrix} l_{11} & l_{21} & l_{31} & \dots \\ 0 & l_{22} & l_{32} & \dots \\ 0 & 0 & l_{33} & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix} = \begin{pmatrix} l_{11}^{2} & \dots & \dots & \dots \\ l_{21}l_{11} & l_{21}^{2} + l_{22}^{2} & \dots & \dots \\ l_{31}l_{11} & l_{31}l_{21} + l_{32}l_{22} & l_{31}^{2} + l_{32}^{2} + l_{33}^{2} & \dots \\ \vdots & \vdots & \vdots & \ddots \end{pmatrix}$$

• Pivoting not needed

- Only lower triangle needed for storage
- Well defined (always works)
- $A = LDL^T$  is sometimes useful, where D is diag.

### Symmetric Indefinite Matrices

- Pivoting Needed :  $PAP^T = LDL^T$
- Ideally, D is diag., but if not possible, then D is tridiag. (Assen) or 1x1/2x2 block diag. (Bunch, Parlett, Kaufmann, etc.)

### 1.6 Banded Matrices

- Similar to normal Gaussian Elim., but less work since more zeroes
- Pivoting means bandwidth will expand no more than double
- Only  $\mathcal{O}(\beta n)$  storage needed

# 1.7 Rank-1 Update with Sherman-Morrison

$$\tilde{A}\tilde{x} = b = (A - uv^{T})\tilde{x}$$

$$\rightarrow \tilde{x} = \tilde{A}^{-1}b$$

$$\tilde{A}^{-1} = (A - uv^{T})^{-1} = A^{-1} + \frac{A^{-1}u}{1 - v^{T}(A^{-1}u)} v^{T}A^{-1}$$

$$\tilde{x} = (A^{-1}b) + \frac{A^{-1}u}{1 - v^{T}(A^{-1}u)} v^{T}(A^{-1}b)$$

$$x + \frac{y}{1 - v^{T}y} v^{T}x$$

General Woodbury Formula:

$$(A - UV^{T})^{-1} = A^{-1} + (A^{-1}U)(I - V^{T}A^{-1}U)^{-1} v^{T}A^{-1}$$

- U and V are general  $n \times k$  matrices
- No guarantee of numerical stability, so caution is needed

# 1.8 Complexity

Explicit Inversion: 
$$D^{-1}M^{-1}I = A^{-1} \rightarrow \mathcal{O}(n^3)$$
,  $A^{-1}b = x \rightarrow \mathcal{O}(n^2)$ 

Gaussian Elimination: 
$$A = LU \longrightarrow \mathcal{O}(n^3/3)$$
,  $LUx = b \longrightarrow \mathcal{O}(n^2)$ 

Gaussian-Jordan: 
$$A = MD \rightarrow \mathcal{O}(n^3/2)$$
,  $MDx = b \rightarrow \mathcal{O}(n)$ 

Symmetric: 
$$A = LL^T$$
  
 $PAP^T = LDL^T$   $\rightarrow \mathcal{O}(n^3/6)$  ,  $LL^Tx = b \rightarrow \mathcal{O}(n^2)$ 

Banded: 
$$A_{\beta} = LU \rightarrow \mathcal{O}(\beta^2 n)$$
,  $LUx = b \rightarrow \mathcal{O}(\beta n)$ 

Sherman-Woodbury: 
$$\tilde{A} = A - uv^T \rightarrow \mathcal{O}(n^2)$$
,  $\tilde{x} = \tilde{A}b \rightarrow \mathcal{O}(n^2)$ 

# 1.9 Diagonal Scaling

Ill-conditioned

$$\begin{pmatrix} 1 & 0 \\ 0 & \epsilon \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} 1 \\ \epsilon \end{pmatrix}$$

Well-conditioned

$$\begin{pmatrix} 1 & 0 \\ 0 & 1/\epsilon \end{pmatrix} \begin{pmatrix} 1 & 0 \\ 0 & \epsilon \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & 1/\epsilon \end{pmatrix} \begin{pmatrix} 1 \\ \epsilon \end{pmatrix}$$

• No general way to correct poor scaling

# 1.10 Iterative Refinement

- $\bullet\,$  Double storage needed to hold original matrix
- $\bullet$   $r_n$  usually must be computed with higher precision than  $x_n$
- $\bullet\,$  Useful for badly scaled systmes, or making unstable systems stable
- If  $x_n$  is not accurate,  $r_n$  might not need better accuracy

#### Least ||r|| Linear Regression/Fit, Ax + r = b2

- $A = A_{m \times n}$  (m > n, underdetermined)
- ||r(y = Ax)|| is cont. & coer.  $\rightarrow \exists ||r(y)||_{\min}$
- r(y) is strictly convex  $\rightarrow y = Ax$  is unique
- $|\operatorname{rank}(A) = n|$   $\Rightarrow A(x_1 x_2) = 0$  (unique x) (full column rank)  $(x_1 x_2) = 0 \rightarrow x_1 = x_2$

# Example - Vandermonde Matrix, A:

$$Ax = \begin{pmatrix} -\vec{f}(t_1) - \\ \vdots \\ -\vec{f}(t_1) - \end{pmatrix} \begin{pmatrix} | \\ \vec{x} \\ | \end{pmatrix} = \begin{pmatrix} y(t_1) \\ \vdots \\ y(t_m) \end{pmatrix} = \begin{pmatrix} | \\ \vec{y} \\ | \end{pmatrix} = (x^T A^T)^T , \quad y(t) = \sum_{i=1}^n x_i f_i(t) = \vec{x} \cdot \vec{f}$$

#### Decompose b: Projector of A, P

$$b = Ax + r$$

$$= y + r$$

$$= Pb + P_{\perp}b$$

## Minimize residual, r:

$$\nabla ||r||_2^2 = 0 \qquad \left(\frac{\partial r^2}{\partial x_i} = 0\right)$$

$$= \nabla \left[ (b - Ax)^T (b - Ax) \right]$$

$$= \nabla \left( b^T b - 2x^T A^T b + x^T A^T Ax \right)$$

$$0 = 2A^T Ax - 2A^T b$$

$$\downarrow$$

$$A^T Ax = A^T b \quad \text{(Solvable with Cholesky)}$$

$$Ax = Pb$$

$$A^{T}Ax = A^{T}Pb = (P^{T}A)^{T}b$$

$$A^{T}Ax = A^{T}b \quad \text{(System of Normal Equations)}$$

 $||r||_2^2 = ||Pr + P_{\perp}r||_2^2 = ||b - Ax||^2$ 

 $= \|Pb - Ax\|_2^2 + \|P_{\perp}b\|_2^2$ 

 $= \|Pr\|^2 + \|P_1r\|^2$ 

# Cross-Product Matrix of A: $A^TA$

Symmetric:  $(A^T A)^T = A^T A$ 

Pos. Def.: 
$$\operatorname{rank}(A) = n$$
  
 $\rightarrow \langle x | A^T A x \rangle = x^T A^T A x$   
 $= (Ax)^T (Ax)$   
 $= \|Ax\|^2 \ge 0$ 

Nonsingular : 
$$A^T A x = 0$$
  
 $\rightarrow ||Ax||^2 = 0 = Ax$   
 $\rightarrow (x = 0)$ 

System of Normal Equations: 
$$A^T A x = A^T b$$

# Pseudoinverse, $A^+$

$$\begin{bmatrix} x = (A^T A)^{-1} A^T b \\ \equiv A^+ b \end{bmatrix} \rightarrow \begin{bmatrix} A^+ \equiv (A^T A)^{-1} A^T \\ A^+ A = I \end{bmatrix}$$

# Ortho. Proj., P

$$\begin{vmatrix} Ax = A(A^T A)^{-1} A^T b \\ = Pb \end{vmatrix} \rightarrow \begin{vmatrix} P = A(A^T A)^{-1} A^T \\ = AA^+ \end{vmatrix}$$

### System of Normal Equations Issues:

• Info can be lost forming  $A^T A$ , e.g,  $A = \begin{pmatrix} 1 & 0 \\ \epsilon & 0 \\ 0 & \epsilon \end{pmatrix} \rightarrow A^T A = \begin{pmatrix} 1 + \epsilon^2 & 1 \\ 1 & 1 + \epsilon^2 \end{pmatrix} \approx \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}$  (singular)

• System of Normal Equations:  $cond(A^TA) = [cond(A)]^2$ 

### 2.1 Error Bounds and Residuals

### Norm and Conditioning:

$$||A|| = \max_{x \neq 0} \left( \frac{||Ax||}{||x||} = \frac{||AA^+b||}{||A^+b||} \right)$$
 
$$\operatorname{cond}(A) = \begin{cases} ||A||_2 \cdot ||A^+||_2 & \operatorname{rank}(A) = n \\ \infty & \operatorname{rank}(A) < n \end{cases}$$

$$A^{T}A(x + \Delta x) = A^{T}A(b + \Delta b) \qquad (A + \Delta A)^{T}(A + \Delta A)(x + \Delta x) = (A + \Delta A)^{T}b$$

 $\bullet \quad \|\Delta x\| \leq \|A^+\| \cdot \|\Delta b\|$ 

$$\rightarrow \frac{\|\Delta x\|}{\|\hat{x}\|} \leq \left(\operatorname{cond}(A) \frac{\|b\|}{\|Ax\|}\right) \frac{\|\Delta b\|}{\|b\|} \\
= \left(\operatorname{cond}(A) \frac{1}{\cos \theta}\right) \frac{\|\Delta b\|}{\|b\|}$$

• Cond. number is a func. of cond(A) and b

•  $Pb \approx 0$  or  $\theta \approx 90^{\circ}$  is highly sensitive

$$\bullet \quad \mathcal{A}^{T} \overrightarrow{Ax} + A^{T} \Delta Ax + (\Delta A)^{T} Ax + (\overline{\Delta A})^{T} \Delta Ax = A^{T} b + (\Delta A)^{T} b$$

$$+ A^{T} A \Delta x + \overline{A}^{T} \Delta A \Delta x + (\overline{\Delta A})^{T} A \Delta x + (\overline{\Delta A})^{T} \Delta A \Delta x$$

• 
$$\|\Delta x\| = \|(A^T A)^{-1} (\Delta A)^T r - A^+ \Delta A x\|$$
  
 $\leq \|(A^T A)^{-1}\| \cdot \|\Delta A\| \cdot \|r\| + \|A^+\| \cdot \|\Delta A\| \cdot \|x\|$ 

$$\rightarrow \frac{\frac{\|\Delta x\|}{\|\hat{x}\|} \le \left( [\operatorname{cond}(A)]^2 \frac{\|r\|}{\|Ax\|} + \operatorname{cond}(A) \right) \frac{\|\Delta A\|}{\|A\|}}{= \left( [\operatorname{cond}(A)]^2 \tan \theta + \operatorname{cond}(A) \right) \frac{\|\Delta A\|}{\|A\|}}$$

# 2.2 Solving $A^TAx = A^Tb$ with an Augmented Matrix

$$\begin{array}{ccc} r + Ax & = & b \\ A^T r & = & 0 \end{array} \Rightarrow \quad \begin{pmatrix} I & A \\ A^T & 0 \end{pmatrix} \begin{pmatrix} r \\ x \end{pmatrix} = \begin{pmatrix} b \\ 0 \end{pmatrix} \quad \Rightarrow \quad \begin{pmatrix} \alpha I & A \\ A^T & 0 \end{pmatrix} \begin{pmatrix} r/\alpha \\ x \end{pmatrix} = \begin{pmatrix} b \\ 0 \end{pmatrix}$$

ullet Solvable with LU Decomp or Symm. Pos. Def. Methods

•  $\alpha$  "controls the relative weights of the two subsystems in chooing pivots from either"

•  $\alpha = \max a_{ij}/1000$  (rule of thumb)

• MATLAB uses it for large, sparse systems

#### 2.3 QR Decomposition

Orthogonal Matrix, 
$$Q$$

$$Q^T Q = Q Q^T = I$$

### QR Factorization

$$A = Q \begin{pmatrix} R \\ 0 \end{pmatrix}$$

### Reduced QR Factorization

$$A = Q \begin{pmatrix} R \\ 0 \end{pmatrix} = \begin{pmatrix} Q_{\parallel} & Q_{\perp} \end{pmatrix} \begin{pmatrix} R \\ 0 \end{pmatrix} = Q_{\parallel} R$$

# $Q^T$ is a span(A) Plane Rotation through $\mathbb{R}^m$ to span( $[R \ 0]^T$ )

2-norm Preserved (Q is a rotation/reflection)

- $\bullet \quad ||Qv||^2 = \langle v|Q^TQv\rangle = ||v||^2$  $||Q^T v||^2 = \langle v|QQ^T v\rangle = ||v||^2$
- $\bullet Q^T = H_n \dots H_1$   $\bullet H_i^T H_i = H_i H_i^T = I$
- $\bullet \ A = [a_1 \ \dots \ a_n] \qquad \bullet \ I_n = [e_1 \ \dots \ e_n]$

$$H_1 a_1 = \alpha_1 e_1 \quad (\|a_1\| = |\alpha_1|)$$

$$H_i \dots H_1 a_i = \sum_{j=1}^{i} c_j e_j = H_n \dots H_1 a_i$$
  
 $(\|a_i\|^2 = |\alpha_1|^2 = \sum_{j=1}^{i} c_j^2)$ 

$$\langle r|a_i\rangle = 0$$
  $(1 \le i \le n)$ 

$$\langle H_i \dots H_1 r | e_i \rangle = 0$$
  $(1 \le j \le i)$ 

# $Q^TA$ rotates A until the column vectors are aligned with certain axes described above

#### A is a Lin. Sum of $Q_{\parallel}$ 's Orthogonal 2.Column Vectors Given by R

$$\left\{ Q_{\parallel} = Q_{m \times n} \mid \operatorname{span}(Q_{\parallel}) = \operatorname{span}(A) \right\}$$

$$\rightarrow Q^+ = (Q^T Q)^{-1} Q^T = Q^T$$

$$\rightarrow P = Q_{\parallel}Q_{\parallel}^T$$

$$\rightarrow Q_{\parallel}^{T}Ax = Q_{\parallel}^{T}Pb = Q_{\parallel}^{T}Q_{\parallel}Q_{\parallel}^{T}b$$

 $=Q_{\parallel}^T b$  (System of Orthogonal Equations?)

$$A = Q_{\parallel} R = \begin{pmatrix} | & | & | \\ \vec{q_1} \dots \vec{q_n} \\ | & | & | \end{pmatrix} \begin{pmatrix} r_{11} \dots r_{1n} \\ 0 & \ddots & \vdots \\ 0 & 0 & r_{nn} \end{pmatrix} = \begin{pmatrix} | & | & | \\ \vec{a_1} \dots \vec{a_n} \\ | & | & | \end{pmatrix}$$

$$\bullet \ \vec{a_j} = \sum_{i}^{j} r_{ij} \cdot \vec{q_i}$$

 $\rightarrow \mid R \text{ transforms the } Q_{\parallel} \text{ column vectors about}$  $\operatorname{span}(A)$ , an  $\mathbb{R}^n$  plane, until they equal the column vectors of A

### Householder Transformation/Elementary Reflector, H

$$H\vec{a_1} = \alpha_1 \vec{e_1} \qquad \|a_1\| = |\alpha_1|$$

$$(\text{rotation})$$

$$= [\vec{a_1} - 2\hat{v}(\hat{v} \cdot \vec{a_1})] \qquad \rightarrow \qquad [H = I - 2vv^T = I - \frac{2vv^T}{v^Tv}] \qquad \bullet \qquad H = H^T = H^{-1}$$

$$(\text{symmetric and orthogonal})$$

• 
$$\alpha_1 e_1 = a_1 - (2v_1) \frac{v_1 \cdot a_1}{v_1 \cdot v_1} \quad \Rightarrow \quad v_1 = (a_1 - \alpha e_1) \frac{v_1 \cdot v_1}{2v_1 \cdot a_1} \quad \text{(magnitude doesn't matter)}$$

$$\qquad \qquad \rightarrow \quad \boxed{v_1 = (a_1 - \alpha e_1)}$$

$$\qquad \qquad \alpha_1 = \pm \|a_1\| \quad \rightarrow \quad \boxed{\alpha_i = -\mathrm{sign}(a_i) \|a_i\|} \quad \text{(avoid "cancellation" in finite-calc. of $v$ above)}$$

$$H_j \dots H_1 a_i = a_i^j \quad \rightarrow \quad \begin{bmatrix} v_{j+1} = \begin{pmatrix} 0 \\ \vdots \\ (a_i^j)_i \\ \vdots \\ (a_i^j)_m \end{pmatrix} - \alpha_i e_i \end{bmatrix} \quad \bullet \quad \text{Store $v_i$ and $R$ into $A$ and an extra $n$-vector.}$$

$$\bullet \quad Q \text{ and $H$ can be computed if needed.}$$

$$\bullet \quad \text{When column $i$ is completed, row $i$ is too.}$$

#### 2.3.2 Givens Rotation, G

$$G = \begin{pmatrix} c & s \\ -s & c \end{pmatrix} \rightarrow Gx = G \begin{pmatrix} a_1 \\ a_2 \end{pmatrix} = \pm \begin{pmatrix} \|a\| \\ 0 \end{pmatrix} \qquad \begin{array}{l} \bullet \quad \text{creates 0's one at a time} \\ \bullet \quad \text{useful for spare matrices} \\ \bullet \quad \text{When column $i$ is completed, row $i$ is too.} \\ \\ \rightarrow C = \frac{a_1}{\sqrt{a_1^2 + a_2^2}} \;, \quad s = \frac{a_2}{\sqrt{a_1^2 + a_2^2}} \\ \end{array}$$

Avoid squaring any number  $\gg 1$  to prevent overflow/underflow

$$\bullet \quad t = \frac{a_2}{a_1} < 1 \quad \rightarrow \quad c = \frac{1}{\sqrt{1+t^2}} \quad , \quad s = c \cdot t$$

• 
$$\tau = \frac{a_1}{a_2} < 1 \rightarrow s = \frac{1}{\sqrt{1+\tau^2}}, c = s \cdot \tau$$

#### 2.3.3 Gram-Schmidt Orthogonalization

$$Q_{\parallel}^{T} = \begin{pmatrix} \widehat{q}_{1} : q_{1} = a_{1} \\ \widehat{q}_{2} : q_{2} = a_{2} - \widehat{q}_{1}(\widehat{q}_{1} \cdot a_{2}) \\ \widehat{q}_{3} : q_{3} = a_{3} - \widehat{q}_{1}(\widehat{q}_{1} \cdot a_{3}) - \widehat{q}_{2}(\widehat{q}_{2} \cdot a_{3}) \\ \vdots \\ \widehat{q}_{n} : q_{n} = a_{n} - \sum_{i}^{n} \widehat{q}_{i}(\widehat{q}_{i} \cdot a_{n}) \end{pmatrix}, \quad R = \begin{pmatrix} \|a_{1}\| & \widehat{q}_{1} \cdot a_{2} & \widehat{q}_{1} \cdot a_{3} & \dots & \widehat{q}_{1} \cdot a_{n} \\ 0 & \|a_{2}\| & \widehat{q}_{2} \cdot a_{3} & \dots & \widehat{q}_{2} \cdot a_{n} \\ 0 & 0 & \|a_{3}\| & \dots & \widehat{q}_{3} \cdot a_{n} \\ \vdots & \vdots & \ddots & \ddots & \vdots \\ 0 & 0 & \dots & 0 & \|a_{n}\| \end{pmatrix}$$

Classical, Column Oriented: Find  $\widehat{q}_i$ , then solve for  $\widehat{q}_{i+1}$ , and continue up to  $\widehat{q}_n$ .

- For a program, obviously  $a_k$  can be replaced by  $q_k$ , so less storage is needed.
- Cancellation that causes loss of orthogonality occurs more when ill-conditioned.
- As a result, performing  $Q_{\parallel}^T b = b_1'$  isn't always best.
- Can't column-pivot, since that depends on rows being completed first.

Modified, Row Oriented: Let  $q_i^{[k]} = a_i - \sum_j^k \widehat{q_j}(\widehat{q_j} \cdot a_i)$ . For all  $1 \leq i \leq n$ , solve for  $q_i^{[k]}$  starting first at k = 1, then continue until k = n.

- Allows for column pivoting since rows are completed first.
- Cancellation, though still present, is less severe.

### Augmented Matrix:

$$\begin{pmatrix} A \mid b \end{pmatrix} = \begin{pmatrix} Q_{\parallel} \mid q_{n+1} \end{pmatrix} \begin{pmatrix} R & b'_1 \\ 0 & \rho \end{pmatrix}$$

$$\begin{pmatrix} \mid & \mid & \mid & \mid \\ a_1 \dots a_n & b \\ \mid & \mid & \mid & \mid \end{pmatrix} = \begin{pmatrix} \mid & \mid & \mid & \mid \\ \widehat{q}_1 \dots \widehat{q}_n & q_{n+1} \\ \mid & \mid & \mid & \mid \end{pmatrix} \begin{pmatrix} r_{11} \dots r_{1n} \mid \\ 0 & \ddots & \vdots & b'_1 \\ \vdots & \ddots & r_{nn} \mid \\ 0 & \dots & 0 & \rho \end{pmatrix}$$

$$\begin{pmatrix} \text{Use Gram-Schmidt QR on this, then solve } Rx = b \\ \text{This method is preferred numerically to reduce cancelling effects}$$

$$\text{Text didn't recommend what } q_{+1} \text{ or } \rho \text{ should be.}$$

$$\bullet \rho \text{ or } (q_{n+1})_i \text{ looks like it should be 0.}$$

$$\bullet \text{Idk, not much explained.}$$

- Use Gram-Schmidt QR on this, then solve  $Rx = b'_1$
- This method is preferred numerically to reduce

Reorthogonalizing: Repeating procedure to straighten vectors (usually not needed)

#### 2.3.4 Factorization with Column-Pivoting

- Column with largest norm is pivoted to the current column i to be reduced, and current row i is completed too.
- Choose the next pivoting column based on norms of the smaller columns from remaining uncompleted submatrix.
- Repeat until the end (rank might be n) or if the max norm is smaller than some tolerance (rank might be k < n)
- Pivoting avoids working with 0's on the diag.

#### 2.3.5 Rank Deficiency (or Other) Case

$$\underline{ \text{If } \operatorname{rank}(A) = k < n } : \begin{bmatrix} (Q^TAP)(P^Tx) & = & Q^Tb \\ \begin{pmatrix} R & S \\ 0 & 0' \end{pmatrix} & \begin{pmatrix} z \\ 0 \end{pmatrix} & = & \begin{pmatrix} b_1' \\ b_2' \end{pmatrix} \end{bmatrix}$$
 • 0' is approx. 0 since the remaining norms are too •  $R = R_{k \times k}$  •  $S$  is the remaining columns after  $R$  is completed. • There are multiple solutions for  $x$ .

- $\bullet$  0' is approx. 0 since the remaining norms are too small.

- For a quick solution,  $Rz = b'_1$ ,  $x = P\begin{pmatrix} z \\ 0 \end{pmatrix}$
- For the minimized-norm solution with the smallest ||x||, S must be annihilated.
- For another method or if underdetermined (m < n), something like SVD Decomp. can be used.

#### 2.4 Singular Value Decomposition (SVD)

$$A = egin{array}{c} U \Sigma V^T \ = egin{pmatrix} igg| igg|$$

- Underdetermined, m < n is possible too.
- Analagous to Gaussian-Jordan Diagonalization method.
- U and V are orthogonal;  $u_i$  and  $v_i$  are the respective "left" and "right" singular vectors.
- Usually, the singular values are ordered such that  $\sigma_1 \geq \sigma_2 \geq \dots$
- $\forall (k < i), \ \sigma_i = 0 \ \Rightarrow \ \operatorname{rank}(A) = k < n$
- $U_{\parallel} = U_{m \times k}$ :  $\operatorname{span}(U_{\parallel}) = \operatorname{span}(A)$ ,  $\operatorname{span}(U_{\perp}) = \operatorname{span}(A)^{\perp}$
- $V_{0\perp} = V_{n \times k}$ :  $\operatorname{span}(V_{0\parallel}) = \operatorname{null}(A)$ ,  $\operatorname{span}(V_{0\perp}) = \operatorname{null}(A)^{\perp}$  $\operatorname{null}(A) = \{x : Ax = 0\}$

 $A^+ \equiv V \Sigma^+ U^T$ Pseudoinverse:  $\Sigma^+ \equiv \left[ \Sigma^T \text{ and } \sigma_i \to 1/\sigma_i \quad \forall (\sigma_i \neq 0) \right]$ 

- $\bullet$   $Ax + r = b \rightarrow$  $x = A^+b = (V\Sigma^+U^T)b$
- $\left| x_{\min} = \sum_{i \in \sigma} \frac{u_i \cdot b}{\sigma_i} v_i \right|$  useful for ill-conditioned or rank deficient since small  $\sigma$  can be dropped.

#### 2.4.1Other uses

Euclidean 2-norm :  $||A||_2 = \max_{x \neq 0} \frac{||Ax||_2}{||x||_2} = \sigma_{\text{max}}$ 

Euclid. Cond. Num.:  $\operatorname{cond}_2(A) = \sigma_{\max}/\sigma_{\min}$ 

Lower Rank Approx.:  $A \approx A_k = \sum_i^k \sigma_i \left( u_i v_i^T \right)$  • Closest rank= k matrix to A in the Frobinius norm. • Frobinius Norm = Euclid. Norm for a "vector" in  $\mathbb{R}^{mn}$ .

Total Least Squares:  $[A \mid y]_{m \times (n+1)} = U \Sigma V_{(n+1) \times (n+1)}^T$ 

 $rank([\widehat{A} \mid y]) \le n \rightarrow \sigma_{n+1} = 0 \rightarrow \widehat{A} \cdot v_{n+1} = 0$ 

 $-\widehat{A}$  is an A with uncertainty, like how y normally is.

 $\begin{bmatrix} \widehat{A} \mid y \end{bmatrix} \cdot \begin{bmatrix} x \\ -1 \end{bmatrix} = 0 \rightarrow \begin{bmatrix} x \\ -1 \end{bmatrix} \propto v_{n+1} = \begin{bmatrix} \overrightarrow{\nu_n} \\ \nu_{n+1} \end{bmatrix} \rightarrow \begin{bmatrix} x = \frac{\overrightarrow{\nu_n}}{-\nu_{n+1}} \end{bmatrix}$ 

# 2.5 Complexity

Normal, Cholesky

- $A^T A = A' \text{ costs } \frac{mn^2}{2}$
- $A' = LL^T$  costs  $\frac{n^3}{6}$
- Rel. Err.  $\propto [\operatorname{cond}(A)]^2$
- Bad if  $\operatorname{cond}(A) \approx 1/\sqrt{\epsilon_{\text{mach}}}$

#### Householder

- $Q^T A = R \text{ costs } mn^2 \frac{n^3}{3}$
- Rel. Err.  $\propto [\operatorname{cond}(A)]^2 ||r||_2 + \operatorname{cond}(A)$
- Bad if  $\operatorname{cond}(A) \approx 1/\epsilon_{\operatorname{mach}}$
- More accurate than Cholesky and broadly applicable
- Usable for rank deficient or nearly rank-deficient

#### Givens

- $\bullet$  The normal implementation needs 50% more work than Householder.
- A more complex implementation makes it comparable to Householder.
- Useful if matrix is sparse or zeros need to be maintained.

### SVD

- $\bullet\,$  Most expensive cost at  $\,\propto\,\,mn^2+n^3$  , perhaps 4-10 times or more.
- Robust and reliable.

# 3 Matrix Information

Orthogonal : 
$$QQ^T = Q^TQ = I$$

Unitary : 
$$UU^{\dagger} = U^{\dagger}U = I$$

$$\Leftrightarrow U = e^{iH} = (U_h)e^{iD_h}(U_h)^{\dagger}$$

Normal: 
$$AA^{\dagger} = A^{\dagger}A \Leftrightarrow A = UDU^{\dagger}$$

Symmetric: 
$$S = S^T = QDQ^T$$
 (D is real)

Hermitian: 
$$H = H^{\dagger} = UDU^{\dagger}$$
 (D is real)

• 
$$Ax = \lambda x$$
,  $\det(A) \neq 0 \Rightarrow A^{-1}x = (1/\lambda)x$ 

• Shifting: 
$$(A - \sigma I)x = (\lambda - \sigma)x$$

Similar:  $A(Ty) = \lambda(Ty)$ 

$$\rightarrow A \sim B = T^{-1}AT$$

Diagonalize: 
$$T^{-1}AT = D$$
  $\begin{pmatrix} A \text{ is nondefective} \\ T \text{ is nonsingular} \\ D \text{ is diag.} \end{pmatrix}$ 

Hessenberg: Triang. from any diag. but with 0s

Jordan Form: Nonsing. trans. into a near diag. w/ entries in diag. above

• Simple: Normal [Algebraic] Mult. of 1

• Defective: Geo. Mult. < Alg. Mult. (eig. vec. #)

Invariant Subspace:  $\{S: (AS \subseteq S) \equiv (\forall x \in S \Rightarrow Ax \in S)\}$ 

### Schur Form

$$\begin{array}{c} \text{Unitary} \\ \text{(for all)} \end{array} \text{:} \quad \begin{array}{c} T^\dagger A T = R \\ \text{($R$ is upp. triang.)} \end{array}$$

$$\bullet \ \ A\vec{x_i} = r_{ii}\vec{x_i}$$

$$\bullet \quad 0 = (R - r_{ii}I) \vec{x_i}$$

$$= \begin{pmatrix} R_{11} - r_{ii}I & \vec{u} & R_{13} \\ 0 & 0 & \vec{v}^T \\ \mathcal{O} & 0 & R_{33} - r_{ii}I \end{pmatrix} \vec{x_i}$$

$$\downarrow \downarrow$$

$$\vec{x_i} = \begin{pmatrix} \vec{y} \\ -1 \\ 0 \end{pmatrix} : \begin{pmatrix} R_{11} - r_{ii}I \end{pmatrix} \vec{y} = \vec{u}$$
(nonsingular)

• "Schur form of a real matrix will have complex entries if the matrix has any complex eigenvalues"

Real (only for real matrix) ( $Q^TAQ = R$ ) (Q is ortho.)
(R is block upp. triang.)

$$\bullet \ R = \begin{pmatrix} R_{11} & \dots & R_{1p} \\ \mathcal{O} & \ddots & \vdots \\ \mathcal{O} & \mathcal{O} & R_{pp} \end{pmatrix}$$

• 
$$\lambda_i(A) = \lambda(R_{ii})$$

• 
$$R_{ii} = \begin{cases} R_{1 \times 1} & \text{(real eigenvalue of } A\text{)} \\ R_{2 \times 2} & \text{(complex eigenvalue pairs of } A\text{)} \end{cases}$$

• All other entries are real

• Reducible: If  $PAP^T = R$  (P is permu.)

Block Upper Triangular Transformation

• 
$$X_{\parallel} = (\vec{x_1} \dots \vec{x_p})$$
,  $Ax_i \in \operatorname{span}(x_i) = S$   
 $\Rightarrow AX_{\parallel} = X_{\parallel}B$ 

• 
$$I_n = X^{-1}X = \begin{pmatrix} Y_{\parallel} \\ Y_{\perp} \end{pmatrix} \begin{pmatrix} X_{\parallel} & X_{\perp} \end{pmatrix} = \begin{pmatrix} Y_{\parallel}X_{\parallel} & Y_{\parallel}X_{\perp} \\ Y_{\perp}X_{\parallel} & Y_{\perp}X_{\perp} \end{pmatrix} = \begin{pmatrix} I_p & \mathcal{O} \\ \mathcal{O} & I_{n-p} \end{pmatrix}$$

$$\bullet \ \, X^{-1}AX = \begin{pmatrix} Y_{\parallel}AX_{\parallel} & Y_{\parallel}AX_{\perp} \\ Y_{\perp}AX_{\parallel} & Y_{\perp}AX_{\perp} \end{pmatrix} = \begin{pmatrix} Y_{\parallel}X_{\parallel}B & Y_{\parallel}AX_{\perp} \\ Y_{\perp}X_{\parallel}B & Y_{\perp}AX_{\perp} \end{pmatrix} = \begin{pmatrix} B & Y_{\parallel}AX_{\perp} \\ \mathcal{O} & Y_{\perp}AX_{\perp} \end{pmatrix} = R$$

# 4 Eigenvalue Equation, $Ax = \lambda x$

# 4.1 Error Bound and Conditioning

$$A + \Delta A = Q(D + \Delta D)Q^{-1}$$

• 
$$v = (\Delta \lambda I - D)^{-1} (\Delta D) v$$

• 
$$\|(\Delta \lambda I - D)^{-1}\|_2^{-1} \le \|\Delta D\|_2$$
  
 $|\Delta \lambda - \lambda_i| \le \|Q(\Delta A)Q^{-1}\|_2$ 

$$\rightarrow |\Delta \lambda - \lambda_i| \leq \operatorname{cond}(Q) \|\Delta A\|_2$$

$$(A + \Delta A)(x + \Delta x) = (\lambda + \Delta \lambda)(x + \Delta x)$$

• 
$$Ax = \lambda x$$
,  $y^H A = \lambda y^H$ 

• 
$$\lambda \text{ is simple } \Rightarrow y^H x \neq 0$$
 (?)

$$\begin{array}{l} \bullet \quad y^H \mathbf{A} \mathbf{x} + y^H \mathbf{A} \Delta x + y^H (\Delta A) x + y^H (\Delta A) \Delta x \\ \\ \approx y^H \mathbf{A} \mathbf{x} + y^H \mathbf{A} \Delta x + y^H (\Delta A) x + y^H (\Delta A) \Delta x \end{array}$$

$$\rightarrow \boxed{ |\Delta \lambda| \lessapprox \frac{\|y\|_2 \cdot \|x\|_2}{|y^H x|} \|\Delta A\|_2 = \frac{1}{\cos \theta} \|\Delta A\|_2}$$

• 
$$AA^{\dagger} = A^{\dagger}A \rightarrow \operatorname{cond}(A) = 1$$

- Non-simple (multiple) eigenvalue is complicated:
- allows  $y^H x = 0$ , depends on eigenvalue spacings, vector angles, etc.
- Balancing (diagonal rescaling) can improve conditioning

# 4.2 QR Iteration

### 4.2.1 Intro

Power Iteration:

$$A^{k}x_{0} = A^{k} \sum_{i=1}^{n} c_{i}v_{i} = \sum_{i=1}^{n} c_{i} \left(A^{k}v_{i}\right) = \sum_{i=1}^{n} c_{i} \left(\lambda_{i}^{k}v_{i}\right)$$

$$= \lambda_{1}^{k} \left[\sum_{i=1}^{j} c_{i}v_{i} + \sum_{i=j+1}^{n} c_{i} \left(\frac{\lambda_{i}}{\lambda_{1}}\right)^{k} v_{i}\right] \xrightarrow{(\lambda_{1} = \dots = \lambda_{j})} (\lambda_{1} \ge \dots \ge \lambda_{n})$$

$$(A^k x_0 = x_k) \approx \lambda_1^k \sum_i^j c_i v_i = \lambda_1^k (c_1 v_1) \text{ if } j = 1$$

Rayleigh Quotient (for shifts):

$$\left[x\lambda + r = Ax\right] \Rightarrow \left[x^H x\lambda = x^H Ax\right] \Rightarrow \left[\lambda = \frac{\langle x|Ax\rangle}{\langle x|x\rangle}\right]$$

Inverse [Power] Iteration:

$$\left[ \left( A^{-1} \right)^k x_0 = x_k \right] \Rightarrow \left[ \left( A x_{k+1} = x_k \right) \to \left( \lambda_1 \to \frac{1}{\lambda_1} \right) \right]$$

Inverse Iteration W/ Shifts:

$$\left[ \left[ (A - \sigma I)^k \ x_0 = x_k \right] \ \Rightarrow \ \left[ (\lambda_1 - \sigma) \to \frac{1}{\lambda_1 - \sigma} \right] \right]$$

Deflation (concept):

$$T^{-1}A_kT = \begin{pmatrix} \lambda_1 & b^T \\ 0 & A_{k+1} \end{pmatrix}$$

Simultaneous/Subspace [Power] Iteration:

$$X_0 = X_{n \times p}$$
,  $\operatorname{rank}(X_0) = p$   
 $\to X_{k+1} = AX_k = A^{k+1}X_0$   
 $\to \lim_{k \to \infty} \operatorname{span}(X_k) = \operatorname{span}(A)$ 

Orthogonal [Subspace] Iteration:

$$X = X_{n \times p}$$
,  $\operatorname{rank}(X) = p$   
 $\to X_k = Q_k R_k$   $(Q = Q_{n \times p})$   
 $\to X_{k+1} = AQ_k \left[ = Q_k B_{p \times p} \right]$ 

### 4.2.2 QR Iteration

$$X_{k+1} \equiv AQ_k \quad (\text{use } X_0 = I \to X_1 = A)$$

$$Q_{k+1}R_{k+1} = Q_k (Q_k^H A Q_k)$$

$$\to A_k \equiv Q_k^H X_{k+1} = Q_k^H A Q_k$$

$$= \begin{cases} (Q_k^H Q_{k+1}) R_{k+1} \equiv Q_{k+1}^{(A)} R_{k+1} \\ Q_k^H (Q_k R_k Q_{k-1}^H) Q_k = R_k Q_k^{(A)} \end{cases}$$

$$\to A_{k+1} = R_{k+1} Q_{k+1}^{(A)}$$

### Inverse QR Iteration

$$\left(A_k^{-H} = Q_{k+1}^{(A)} R_{k+1}^{-H}\right), \left(A_{k+1}^{-H} = R_{k+1}^{-H} Q_{k+1}^{(A)}\right) 
\to \left(A^{-H}\right)^k = Q_k R_k^{-H}$$

### QR Iteration with Shifts

Rayleigh Quotient Shift:  $\sigma = \frac{\langle q_p|A|q_p\rangle}{\langle q_p|q_p\rangle} = \langle q_p|A|q_p\rangle$ 

$$\rightarrow Q_{k+1}^{(A)} R_{k+1} = A_k - \sigma I$$

$$\rightarrow R_{k+1}Q_{k+1}^{(A)} = A_{k+1} + \sigma I$$

$$\rightarrow$$
 Deflation:  $\lim_{k \to \infty} A_k = \begin{pmatrix} A'_{k+1} & b^T \\ 0 & \lambda_p \end{pmatrix}$ 

# Hessenberg QR Iteration

Rayleigh Quotient Shift:  $\sigma = \frac{\langle q_p | A | q_p \rangle}{\langle q_p | q_p \rangle} = \langle q_p | A | q_p \rangle$ 

$$\rightarrow Q_{k+1}^{(A)} R_{k+1} = A_k - \sigma I$$

$$\rightarrow R_{k+1}Q_{k+1}^{(A)} = A_{k+1} + \sigma I$$
